

PROJECT REPORT

Name = Salsabila Hana Adniah

NRP = 5025251191

Class = Pweb D

URL = <https://salsa-surabaya-explore.vercel.app/>

1. Design Concept & Structure

The site is a small personal portfolio made of five static pages that share one visual language: **Home**, **Profile**, **Hometown**, **Local Food**, and **Tourist Places**. Every page reuses the same header, footer, and design tokens, so navigating between pages feels like one continuous site rather than five separate documents.

Visual Design

- **Color Palette:** Built around a "heroic red" (color-primary: #b3231c) and warm orange accent, a nod to Surabaya's nickname "Kota Pahlawan" (City of Heroes). A parallel dark palette is defined for dark mode.
- **Typography:** Pairs Poppins (headings) with Inter (body text), loaded from Google Fonts.
- **Layout:** Card-based throughout:
 - ❖ Media card for image plus text items (home shortcuts, food, tourist places, hometown facts),
 - ❖ stat-list and pill tags for the profile summary,
 - ❖ accordion for the longer hometown content so the page stays scannable.
- **Navigation:** A sticky header with a horizontal link list on desktop that collapses into a toggleable dropdown on mobile (< 720px), plus a persistent dark/light toggle and a "back to top" button that appears after scrolling.

File Structure

Index.html	Homepage
profile/index.html	Profile page
hometown/index.html	Hometown page
food/index.html	Local Food page
tourist/index.html	Tourist Places page
assets/	
css/style.css	Shared stylesheet (design tokens, layout, components)
js/main.js	Shared interactivity
img/	Photos and illustrations, grouped by page/section

Each page folder holds its own index.html so links stay clean (/profile/ instead of /profile.html), which also makes the site easy to extend with more pages later without touching what already exists.

2. Code & Implementation Choices

- **HTML:** Plain, semantic HTML per page (<header>, <nav>, <main>, <section>, <footer>), with no templating engine or framework. For a five-page site, this keeps things simple to read and deploy anywhere, at the cost of repeating the header/footer markup in each file.
- **CSS (assets/css/style.css):** Design tokens (colors, spacing, shadows, fonts) are defined once as custom properties on :root, then reused everywhere. Dark mode is handled two ways: automatically via @media (prefers-color-scheme: dark), and manually via a data-theme="dark" attribute the toggle button sets, so the site respects the visitor's system preference by default but still lets them override it.
- **JavaScript (assets/js/main.js):** A single vanilla-JS file with zero dependencies that runs after DOMContentLoaded and wires up:
 - Mobile navigation toggle,
 - Active-link highlighting by comparing the current URL path against each navigation link,
 - Accordion on the Hometown page (expand/collapse via max-height transitions),
 - Filter tabs on Local Food and Tourist Places (shows/hides cards by matching a data-category attribute),
 - Back-to-top button visibility on scroll,
 - Dark/light theme toggle, persisted with localStorage (wrapped in try/catch in case storage is unavailable, e.g., in private browsing mode).
- **Icons:** All interface icons (menu, back-to-top, accordion chevron, theme toggle) are hand-written inline SVGs using stroke="currentColor" / fill="currentColor", so they automatically match the current text color in both light and dark mode without extra CSS rules or image requests.
- **Images:** Every page uses actual provided photos and illustrations instead of placeholders, organized under assets/img/<page>/, one image per card or section (profile photo, hometown nickname/population illustrations, 7 local dishes, 7 tourist places).
- **Google Maps Embed:** The Hometown page's Location card embeds Google Maps via a plain iframe pointed at Google's public output=embed endpoint centered on Surabaya. This needs no API key, keeps the page working without any external JS SDK, and shows visitors exactly where the city is.
- **Responsive Layout:** Card grids use CSS Grid with repeat(auto-fit, minmax(240px, 1fr)) so the number of columns adapts to the viewport automatically, and the profile page's two-column split layout collapses to a single column under 720px.

3. Analysis & Evaluation

Strengths

- **Zero Build Step & Zero Runtime Dependencies:** The site can be served from any static host (GitHub Pages, Netlify, plain file server) with no compilation required.
- **Consistent Visual System:** A single source of design tokens keeps all five pages visually uniform. Adding a new page mostly means copying the existing header/footer and writing new content inside `<main>`.
- **Flexible Dark Mode:** Works both automatically (system preference) and manually (explicit toggle), covering the two most common user expectations.
- **Lightweight Interactivity:** Interactive elements (accordion, filters, nav toggle) are small, dependency-free, and easy to maintain within a single ~80-line JavaScript file.

Limitations

- **HTML Duplication:** Because there is no templating engine, shared markup (header, footer, nav links) is duplicated across all five HTML files. Any structural change to navigation requires editing five separate files.
- **Image Optimization:** High-resolution source photos are not yet compressed or served in responsive sizes, which could slow down initial loads on slower connections. Adding `loading="lazy"` and resized/optimized image variants would improve performance.
- **Third-Party Map Dependency:** The Google Maps embed relies on an external domain, presenting a minor privacy and performance trade-off. While mitigated with `loading="lazy"` and restrictive referrer policy, a static map image would remove external requests entirely.
- **Accessibility Enhancements Needed:** Focus states rely on default browser styles, and there is no explicit "skip to content" link for keyboard users.

4. Conclusion

The result is a small, self-contained personal website that introduces who I am, my hometown Surabaya, and the food and places that define it, built entirely with HTML, CSS, and vanilla JavaScript.

The project prioritized a clean, reusable design system (colors, typography, card components) and straightforward, dependency-free interactivity over framework overhead—fitting well for a project of this scale. The primary opportunities for future improvement include reducing HTML duplication (e.g., using a static site generator if expanded) and optimizing images for performance.

PERSONAL WEBSITE

Hi, I'm Salsabila Hana Adniah, welcome to my personal website.

A small static site built with HTML, CSS & JavaScript, sharing a bit about myself and my hometown, Surabaya, its story, its food, and the places worth visiting.

View My ProfileExplore Surabaya

What you'll find here

Four short stops that make up this site.

Profile

Who I am, what I study, and what I'm interested in.

Hometown

A short introduction to Surabaya, the City of Heroes.

Local Food

Signature dishes that define Surabaya's food scene.

Tourist Places

Landmarks and spots worth visiting around the city.

PROFILE

About Me

A quick introduction, who I am, what I'm studying, and what I care about.

Hello, I'm Salsa

I'm Salsabila Hana Adniah, usually called Salsa, an Informatics Engineering student with Student ID 5025251191.

Lately I've been interested in humanoid robot soccer, computer vision, and artificial intelligence, alongside my main focus on software engineering.

Interests

Humanoid Robot SoccerComputer VisionArtificial IntelligenceSoftware Engineering

Goals

To grow into a software engineer, building on these interests in AI, computer vision, and robotics along the way.

Home Town

Salsa

HomeProfileHometownLocal FoodTourist Places

HOMETOWN

Surabaya, the City of Heroes

Surabaya is the capital of East Java and the second-largest city in Indonesia, a busy port city with a strong sense of history and identity.

Open in Maps

Location

East Java province, on the northern coast of Java island, facing the Madura Strait.

Nickname

"Kota Pahlawan" (City of Heroes), symbolized by Suro the shark and Boyo the crocodile.

Population

Around 2.9 million people in the city itself, with millions more in the greater metropolitan area.

LOCAL FOOD

Tastes of Surabaya

Surabaya's food scene is bold, savory, and full of character. Here are a few dishes that define it, filter by type below.

AllSoupSaladGrilledSnack

Rawon

Soup

A dark, richly spiced beef soup colored by keluak (black nut), served with rice, bean sprouts, and salted egg. One of Surabaya's most iconic dishes.

Rujak Cingur

Salad

A distinctive mixed salad of vegetables, fruit, tofu, tempeh, and cingur (beef snout), tossed in a thick, pungent peanut-petis (shrimp paste) sauce.

Lontong Balap

Soup

Rice cakes (lontong) with bean sprouts, fried tofu, and lentho (bean fritters), served in a light savory broth and topped with petis and fried shallots.

Sate Klop

Grilled

Satay coated in seasoned grated coconut before grilling, giving it a smoky, nutty flavor that's different from typical Indonesian satay.

Tourist Place

Salsa

TOURIST PLACES

Places to Visit in Surabaya

From historic monuments to seaside parks, here are some spots worth putting on your itinerary, filter by type below.

AllHistoricalNature & FamilyLandmark

Tugu Pahlawan

Historical

The Heroes' Monument, an 41-meter obelisk commemorating the Battle of Surabaya in 1945. An underground museum beneath it tells the story of the independence struggle.

House of Sampoerna

Historical

A Dutch colonial-era building turned museum and working cigarette factory, showcasing the history of the Sampoerna family and traditional hand-rolled kretek production.

Monumen Kapal Selam (Mankasel)

Historical

A real decommissioned Indonesian Navy submarine (KRI Pasopati) turned into a walk-through museum in the middle of the city, a favorite for a quick, unusual outing.

Pantai Kenjeran (Kenjeran Beach)

Nature & Family

A coastal recreation area with a beach, seafood stalls, and the striking red Kenjeran Bridge nearby, a relaxed spot to watch the sunset over the Madura Strait.
